Networks, Complexity and Innovation

6 Rules for Managing
Innovation in the Networked
Economy Area

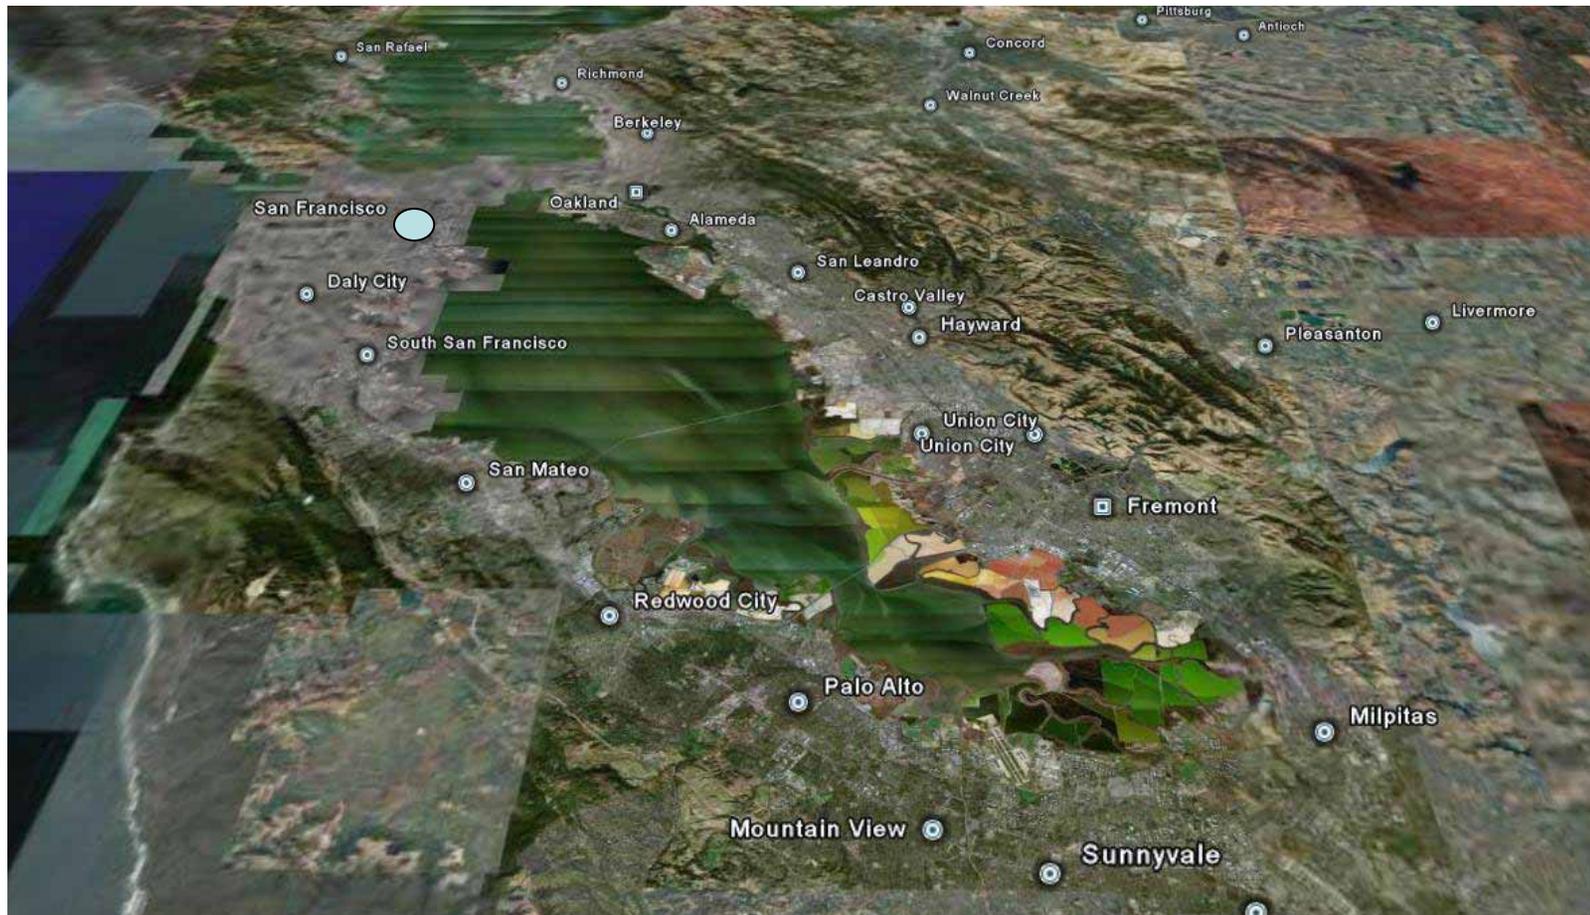

FAS.research

Network Analysis for Science and Business

Cities and towns...

... are linked through railways

Economic infrastructure

- Bridges, roads, railroads, pipelines etc. are the material infrastructure of an economy for creating value

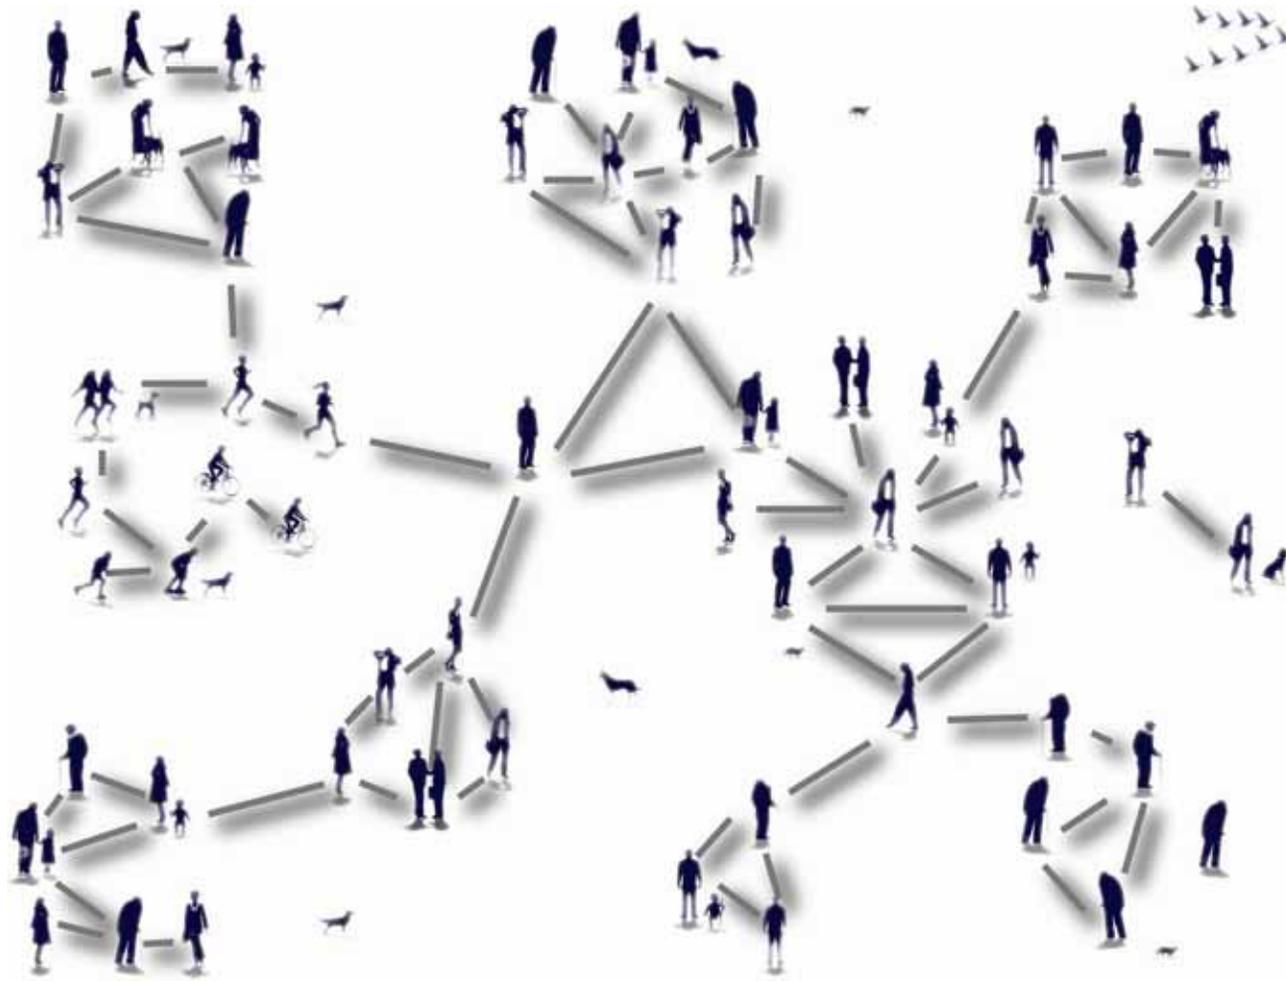

People, firms, organizations ...

...are linked through relationships

- Working relations
- Common projects
- Friendship
- Kinship
- Common interests
- etc.

Social infrastructure

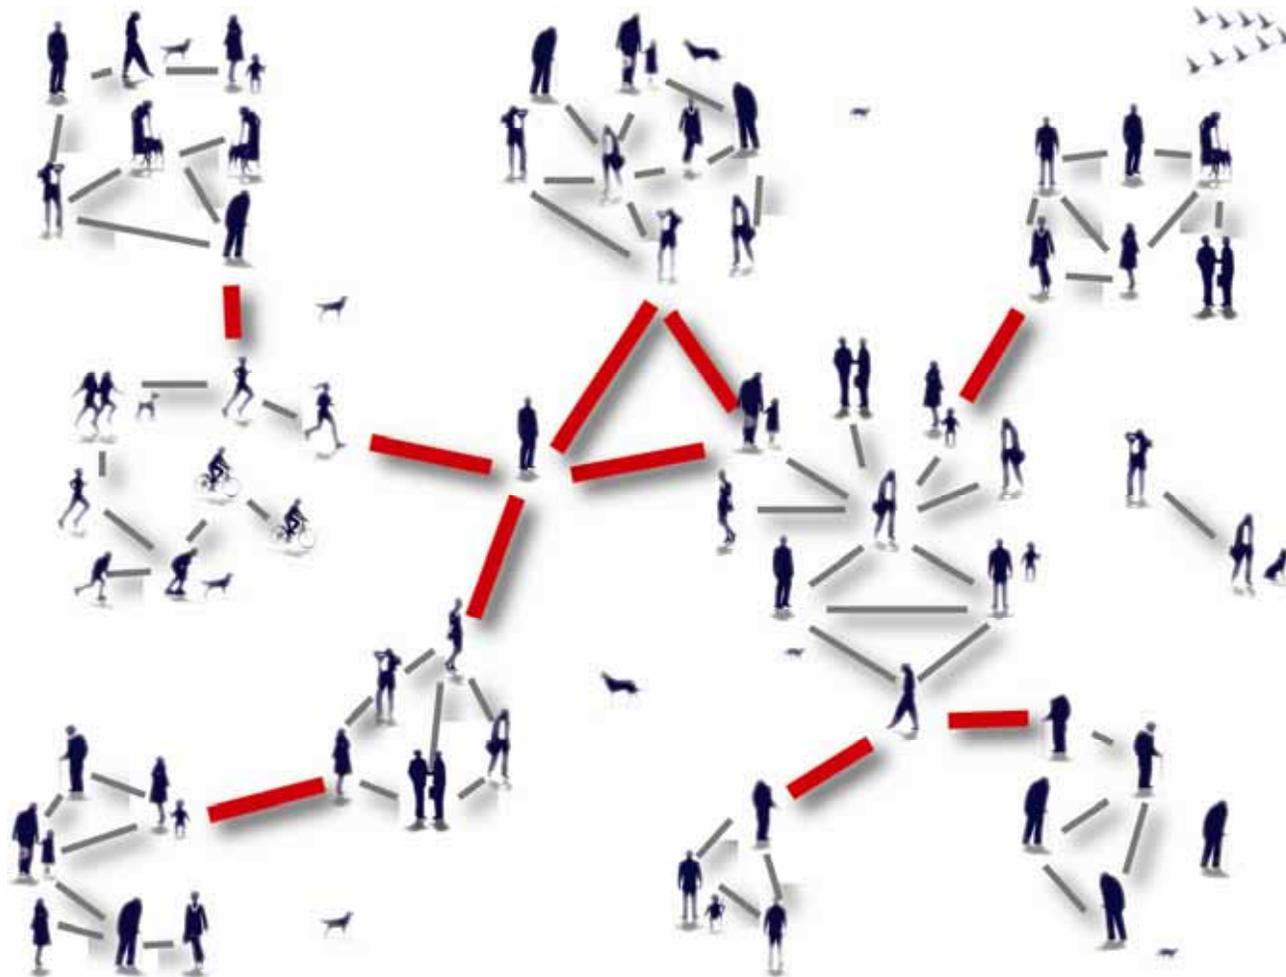

- Networks between people, communities, and organizations are the intangible infrastructure for learning, adapting, creating value and being economically successful.

Excellent networks...

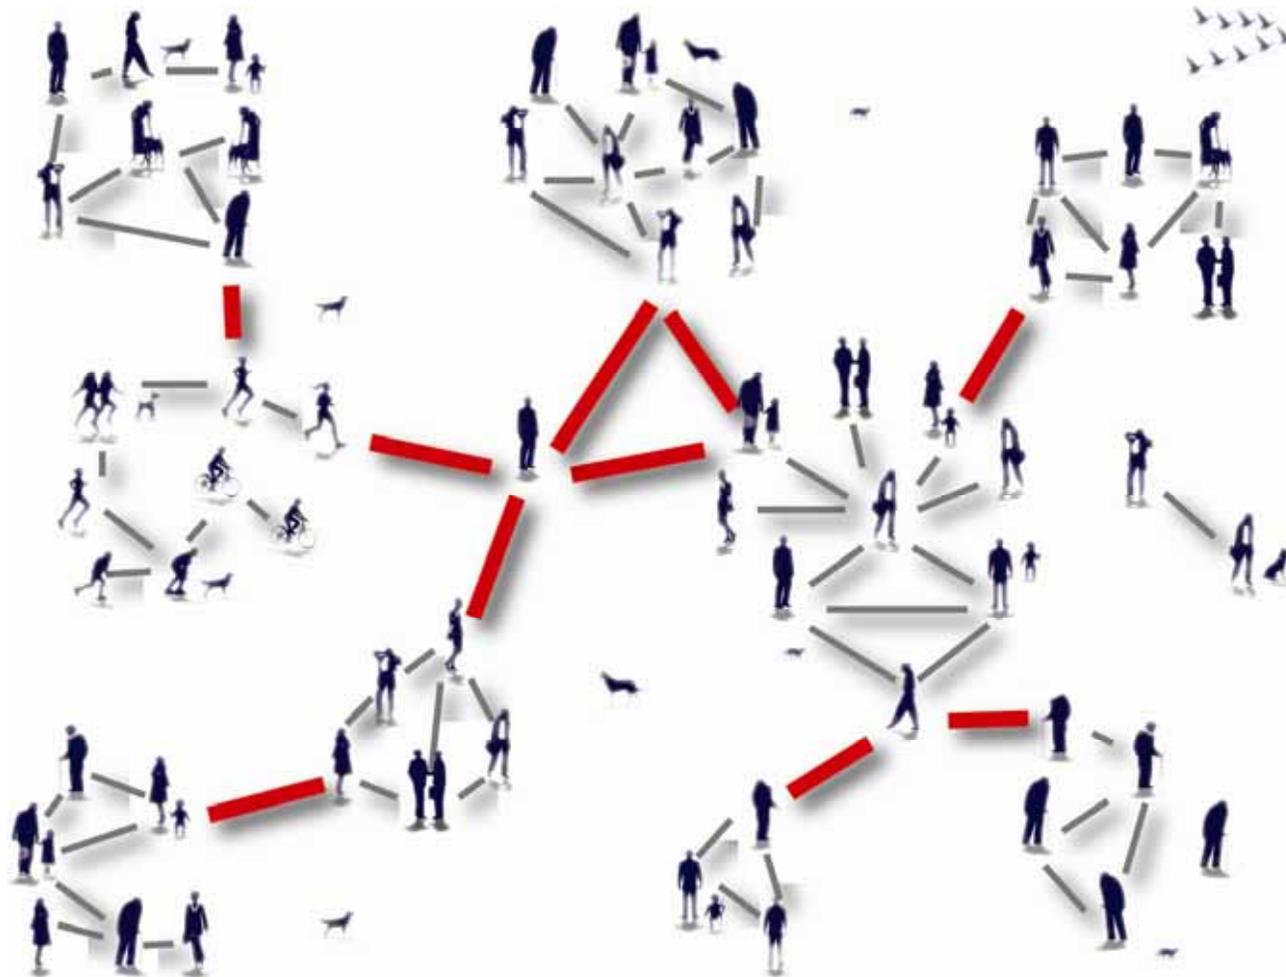

Excellent networks bridge clusters...

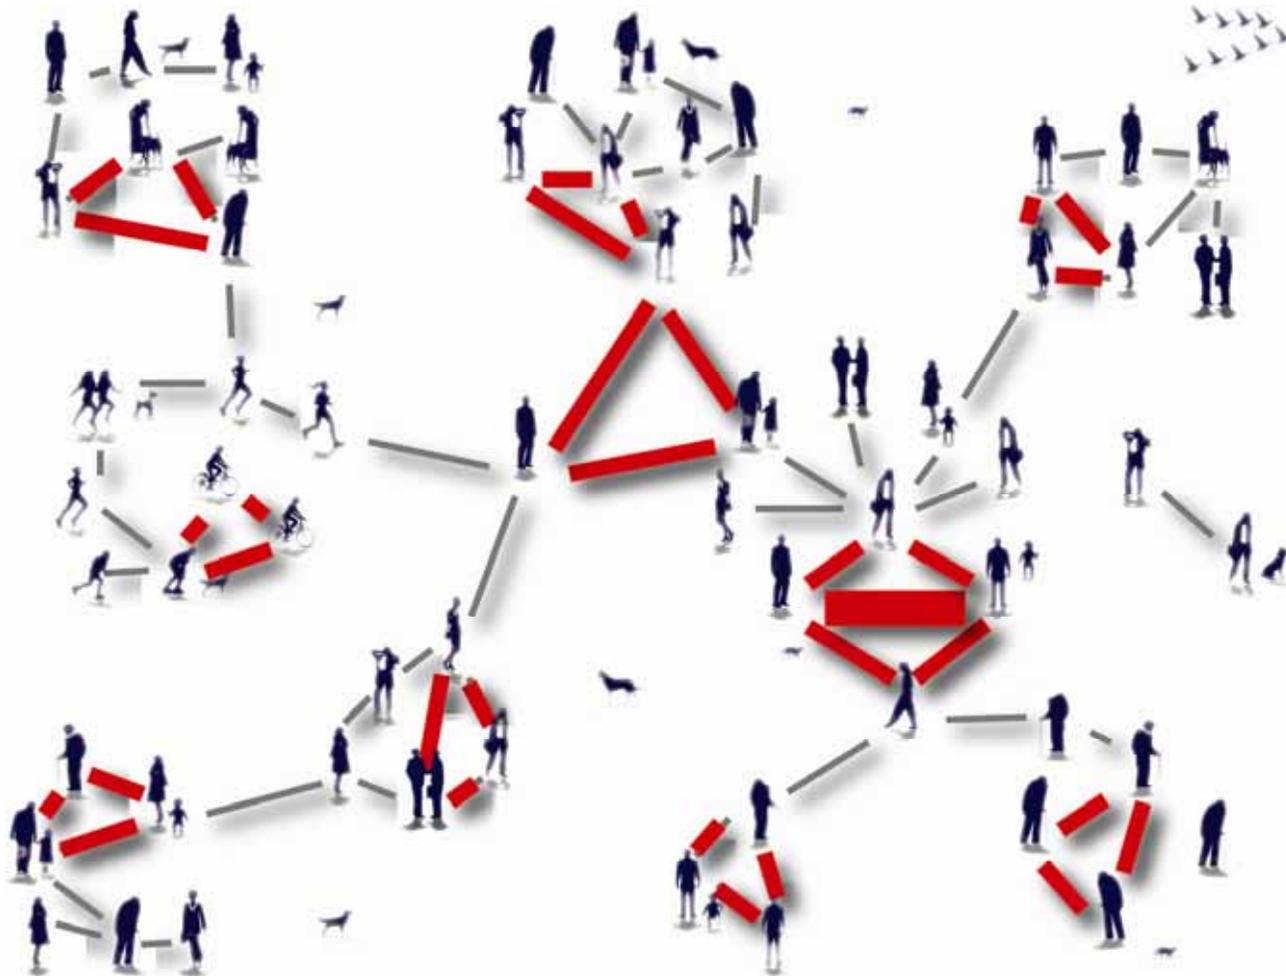

Excellent networks bridge clusters...

- Flow of resources and information
- Access to ideas, resources
- Exchange of solutions and experiences

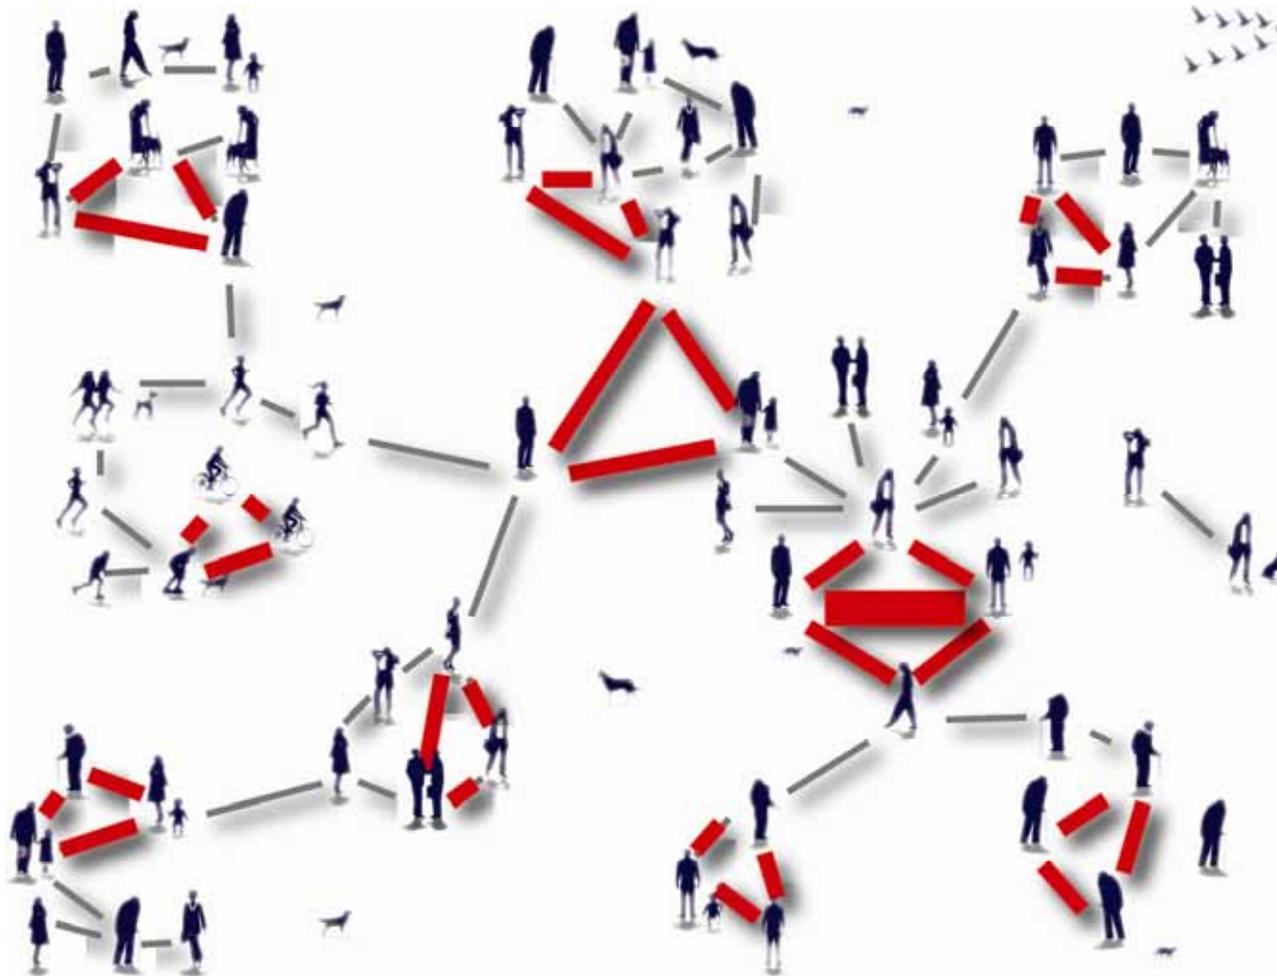

...are robust

...are robust

- Triangles = stability
- Critical masses of knowledge and technologies
- Home bases for the spread of new influence

Competitive variables

- 1** Capital “Economies who do better provide more capital for in R & D”
- 2** Knowledge “Economies who do better educate and attract better human capital.”
- 3** Networks “Economies who do better have better innovation networks.”

Competitive variables

- ① Financial (Venture) Capital
- ② Human Capital
- ③ Social Capital

6 rules for managing (regional) innovation

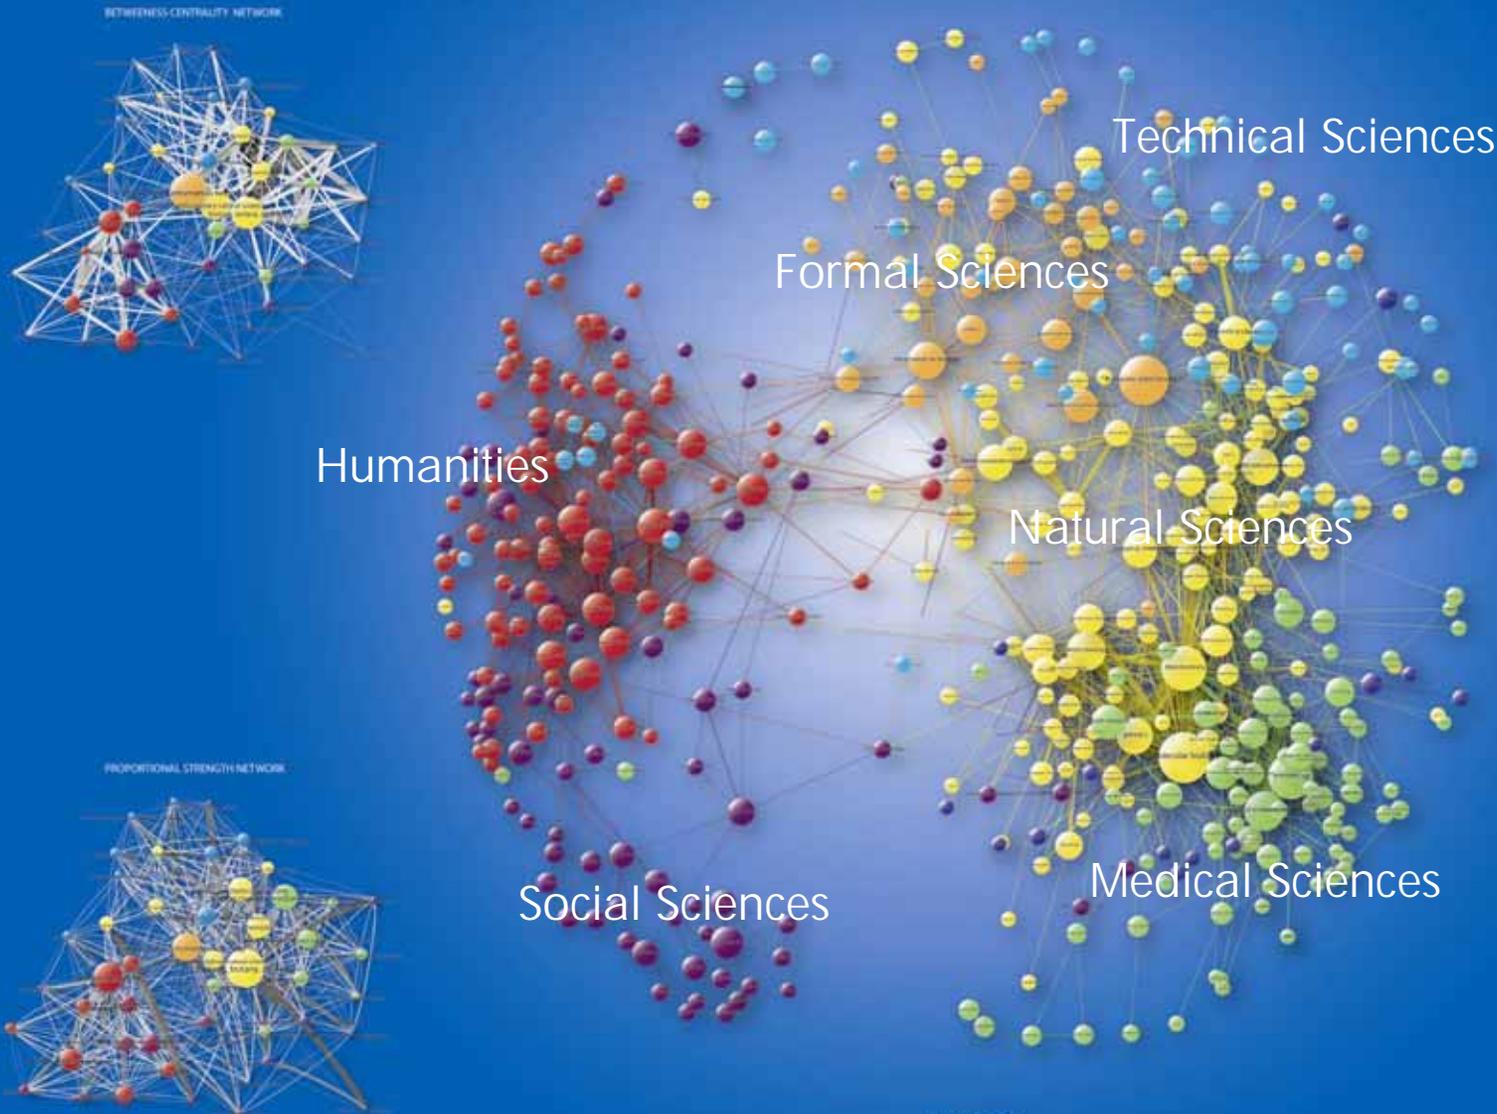

(developed for the Austrian Council)

1. Know your innovation network!

Co-occurrence of assigned scientific classification codes in 5217 projects funded by the Austrian Sciences Fund (FWF) from 1994 to April 2004

LEGENDE

- HUMANITIES AND PHILOSOPHY
- SOCIAL SCIENCES AND LAW
- FORMAL SCIENCES
- ENGINEERING AND TECHNOLOGY
- NATURAL SCIENCES
- MEDICAL SCIENCES
- INTERDISCIPLINARY SCIENCES

NETWORK DRAWN BY

Florian L. J.
Andreas Hutterer (G)
FAS (www.fas.at), 2005

THE SCIENTIFIC FIELD OF AUSTRIA

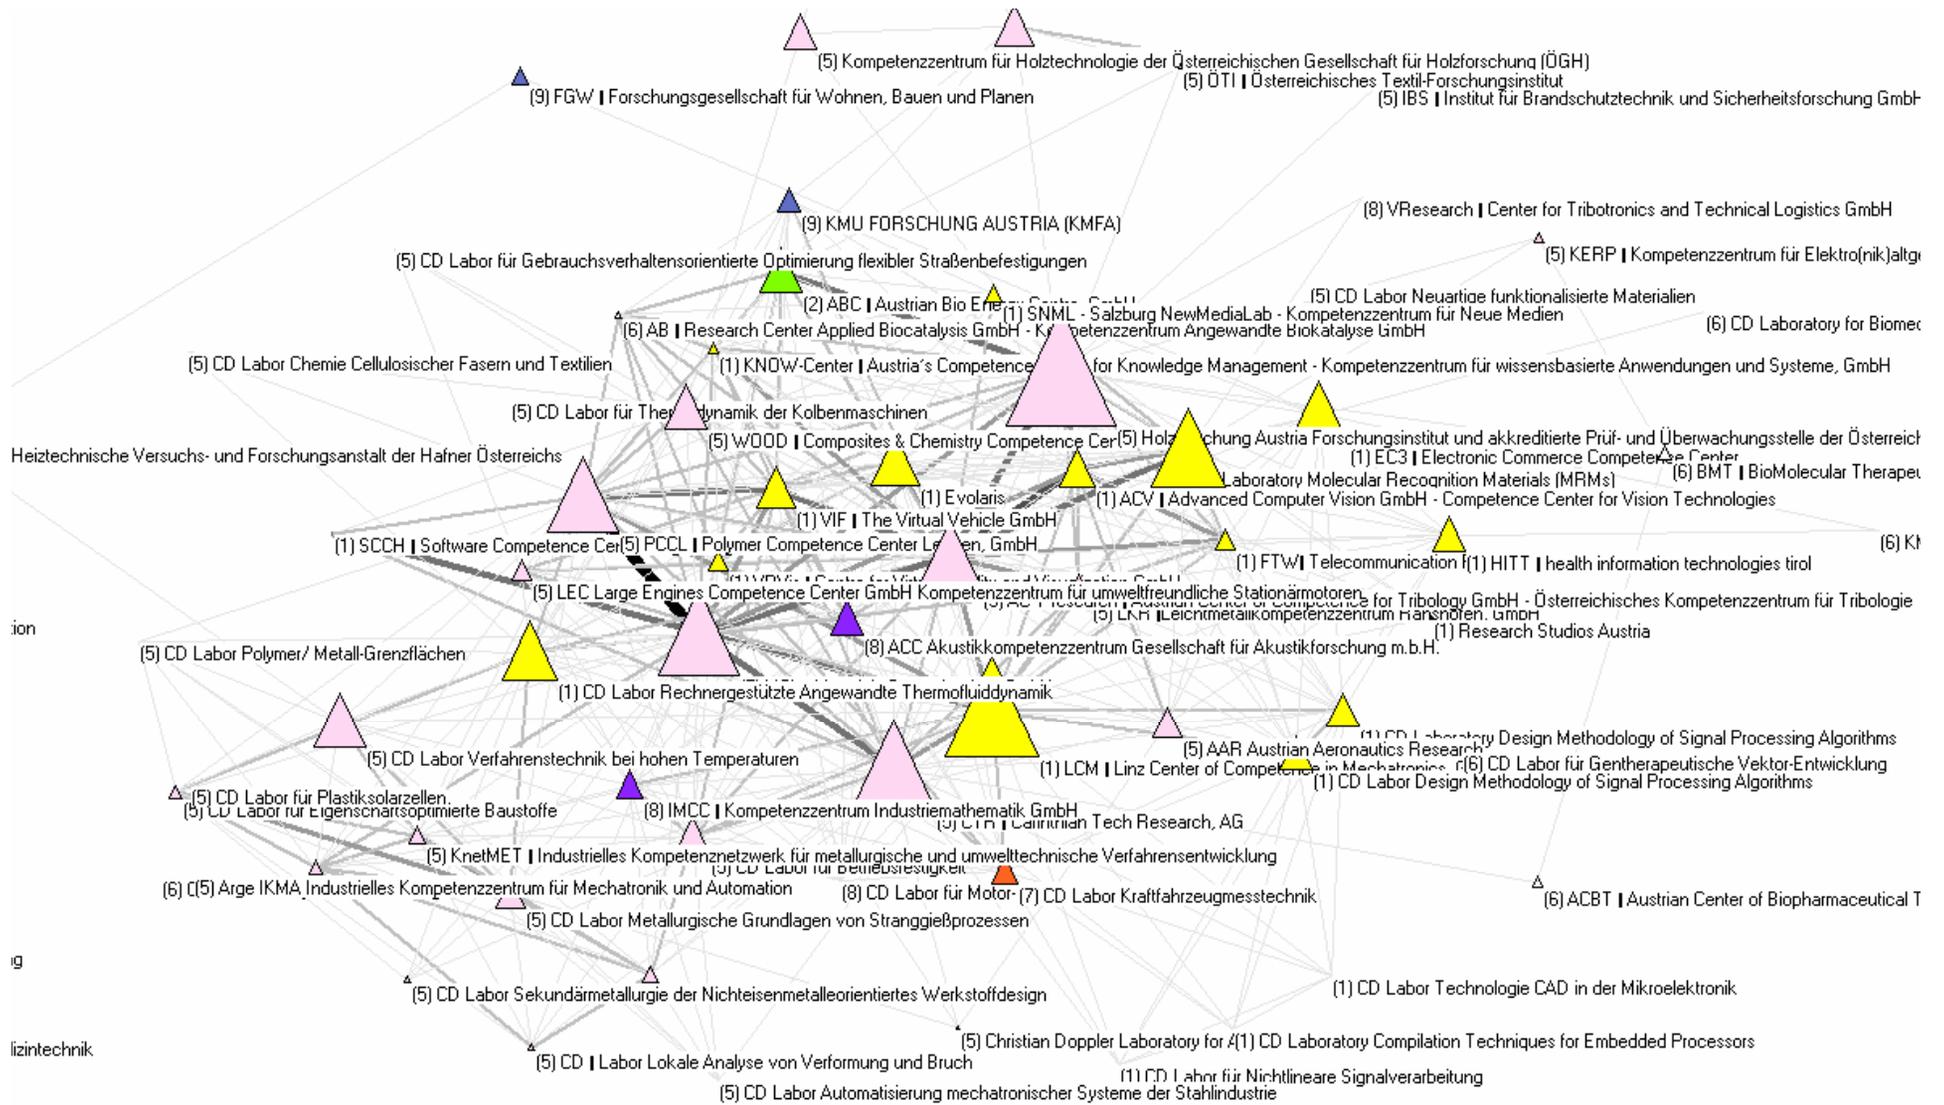

The network shows the relationship of classification codes assigned to the subjects of a program by 5217 projects funded by the Austrian Sciences Fund (FWF) from 1994 to April 2004. The classification codes are assigned to the subjects of a program by the Austrian Sciences Fund (FWF) from 1994 to April 2004. The network shows the relationship of classification codes assigned to the subjects of a program by 5217 projects funded by the Austrian Sciences Fund (FWF) from 1994 to April 2004. The network shows the relationship of classification codes assigned to the subjects of a program by 5217 projects funded by the Austrian Sciences Fund (FWF) from 1994 to April 2004.

BETWEENNESS-CENTRALITY NETWORK

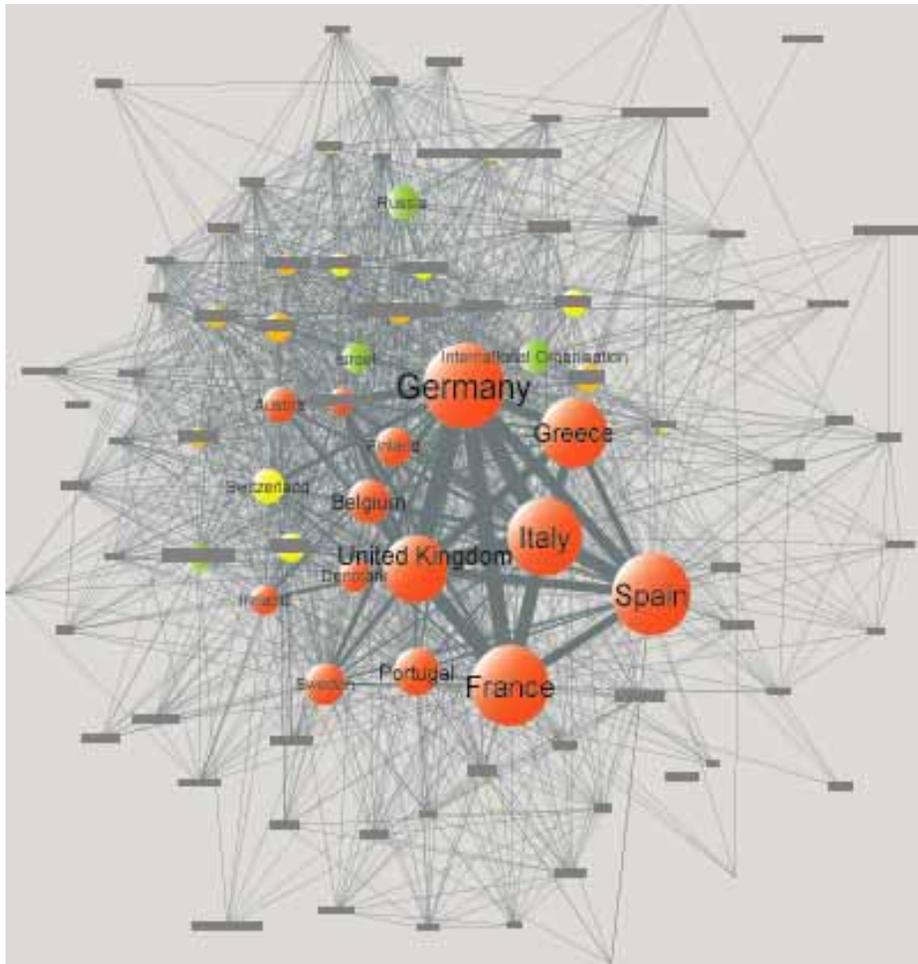

The size of the nodes in this network is proportional to the betweenness centrality of the nodes. The betweenness centrality of a node is a measure of the number of shortest paths between other nodes in the network that pass through the node. The size of the nodes in this network is proportional to the betweenness centrality of the nodes. The betweenness centrality of a node is a measure of the number of shortest paths between other nodes in the network that pass through the node.

PROPORTIONAL STRENGTH NETWORK

The size of the nodes in this network is proportional to the strength of the nodes. The strength of a node is a measure of the sum of the weights of the edges incident to the node. The size of the nodes in this network is proportional to the strength of the nodes. The strength of a node is a measure of the sum of the weights of the edges incident to the node.

- 1=ELECTRONICS, INFORMATION TECHNOLOGIES AND TELECOMMUNICATION
- 2=ENERGY
- 3=ENVIRONMENT AND SAFETY
- 4=FOOD
- 5=INDUSTRIAL PRODUCTION AND TECHNOLOGIES, MATERIAL TECHNOLOGIES
- 6=LIFE SCIENCES
- 7=MEASUREMENTS AND STANDARDS
- 8=PHYSICAL AND EXACT SCIENCES
- 9=SOCIO-ECONOMY AND CULTURAL SCIENCES

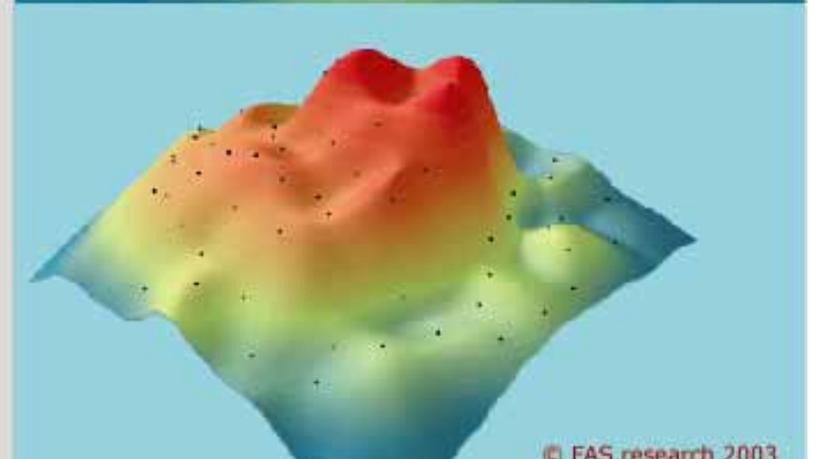

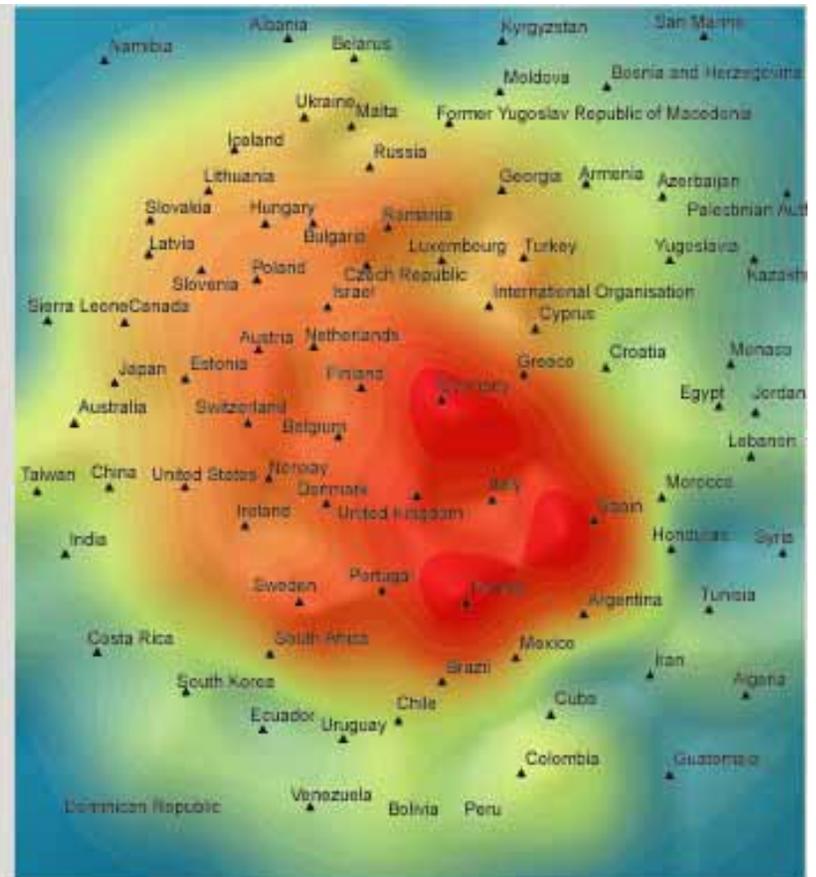

IST Projects 1999-2001

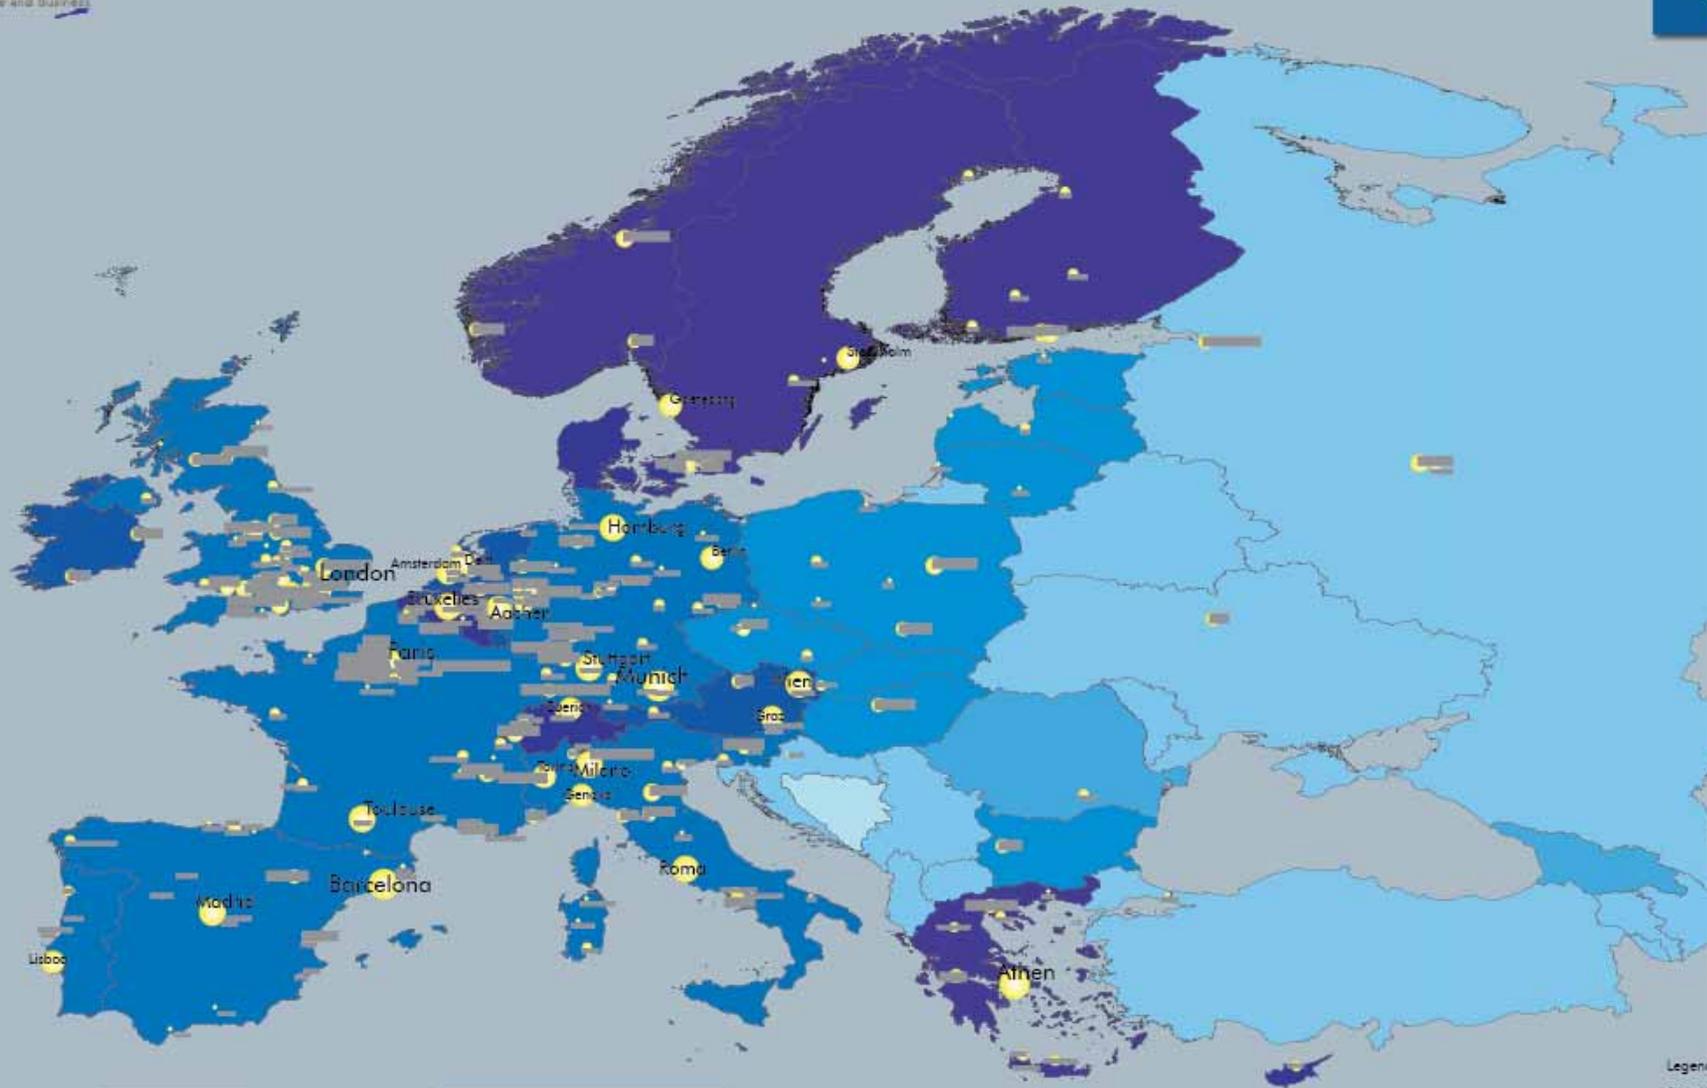

The graph above illustrates the interconnection of countries as a result of collaboration in the same IST Projects and their level of activity. The bigger the circle, the higher the level of activity of a certain country in IST Projects. Strong lines connecting two countries indicate an intense research liaison.

- | | |
|---|---|
| ■ European Union member states | ■ New member states |
| ■ Other European Countries | ■ Rest of the world |

The same data was conveyed to the illustration on the upper left. Mountains (red) account for a high level of activity in IST Projects. Neighbourhood indicates an intense research liaison.

GEOGRAPHIC MAP OF EUROPEAN RESEARCH ON SIMULATION

INFORMATION

This map is based on data that derive from the CORDIS database of the European Union (<http://www.cordis.europa.eu/it/>)

In coherence with the exhibition the database was scanned for projects dealing with the subject of "simulation". Looking at the period from 1996 to 2008 altogether 926 projects were identified, comprising 3502 different partner organizations that were involved in these projects.

The map illustrates home cities of organizations that contributed to at least 10 projects.

The size of nodes indicates the activity of a city/location. The more often the home location of any participant was part of a consortium

The background color of the European Countries indicates the activity of the country in the research field of "simulation". The activity is measured as the number of projects a country is part of, normalized by the number of inhabitants (number of projects per 1,000,000 inhabitants).

The lighter the color the lower the normalized number of projects, the darker the country's surface the higher the number.

The highest number of projects we can find in Denmark (about 20 projects per 1,000,000 inhabitants), in Sweden (19), in

Legend

Cities: N

- 2 - 1
- 9 - 1
- 18 - 1
- 26 - 1
- 31 - 1
- 76 - 1
- Mer

Countries: 1,000,00

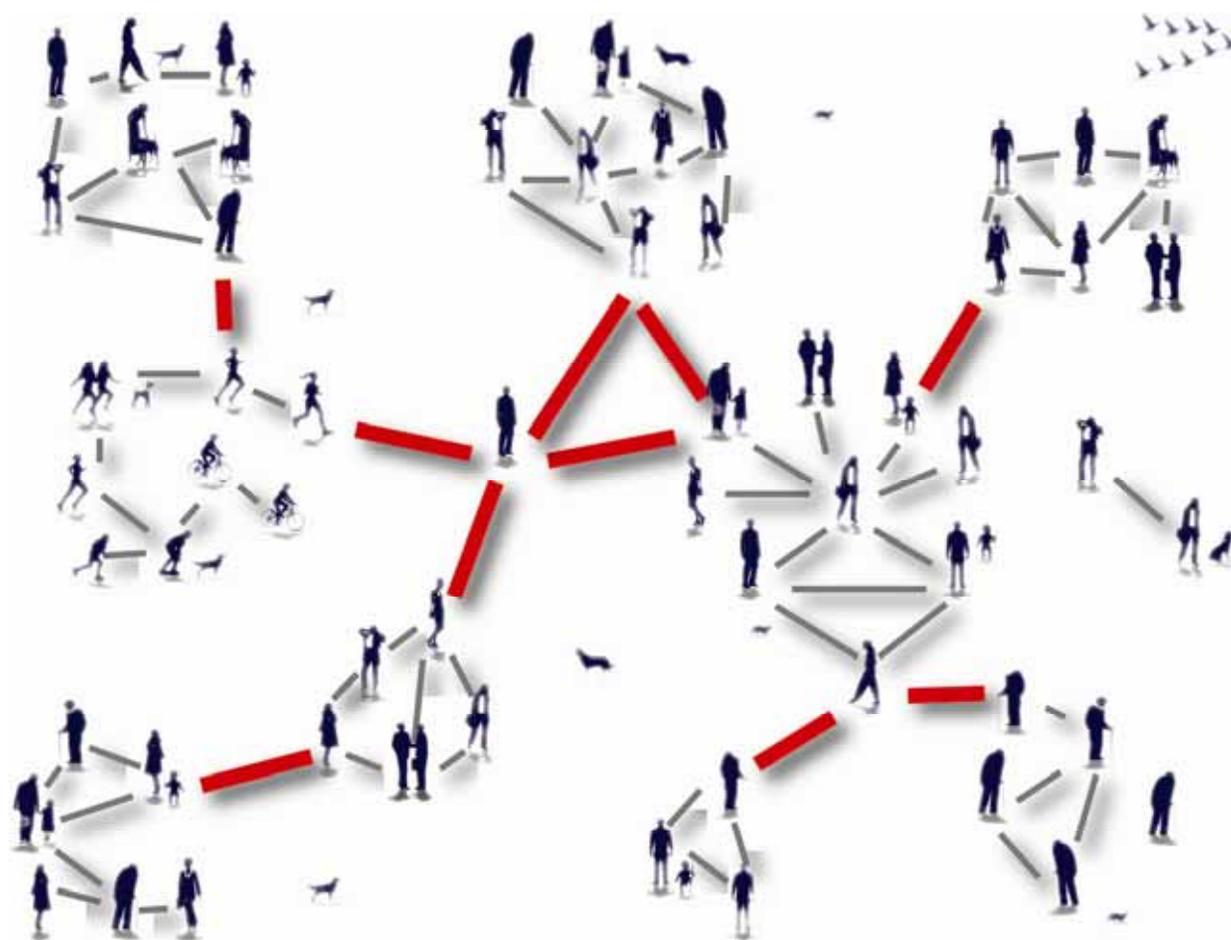

- 0 - 1
- 0.5
- 1.0
- 5.0
- 10.0

2. Keep your landscape connected!

Excellent networks bridge clusters...

- Bridge disconnected communities, complementary technologies and initiatives
- Flow of resources and information
- Exchange of solutions and experiences

3. Facilitate cross-technology skunk works!

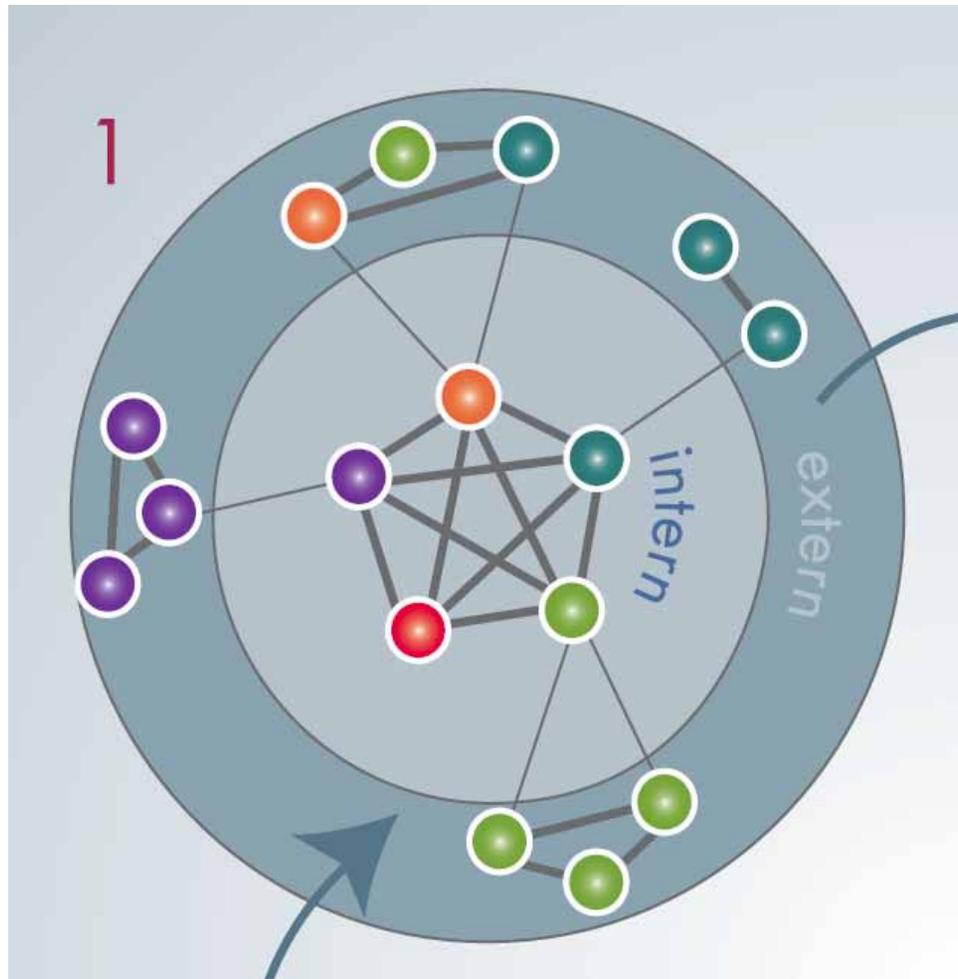

Schumpeter

- Innovations are the outcome of a **new connectivity** between already existing knowledge, attitudes, codes, models or approaches

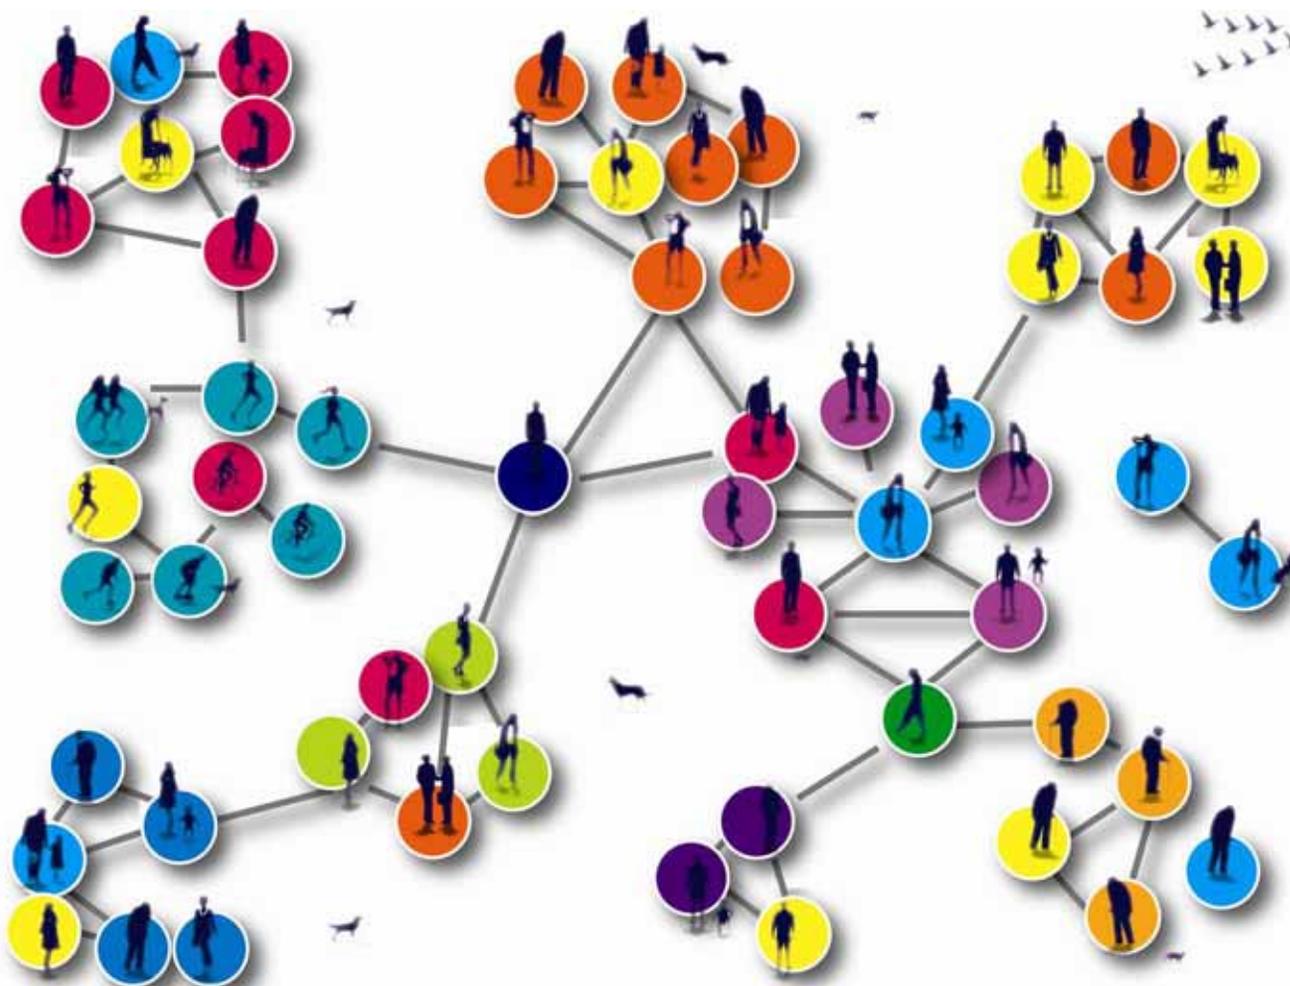

Skunk group

Diversity rules

- Different attributes, different thoughts
- Innovations
- Emergent, self-organizing potential (complexity theory)

Foster excess of new ideas!

Regard the 100 : 10 : 3 rule

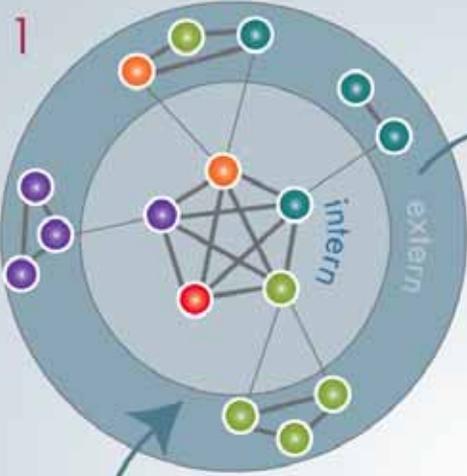

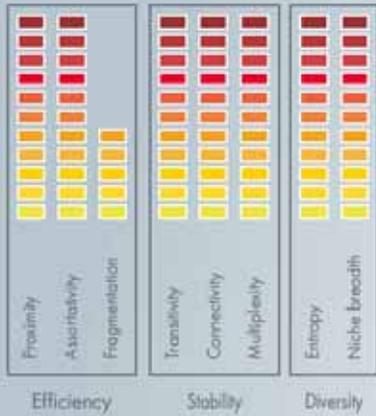

out of ...

- 100 ideas only...
- 10 are good ideas from which...
- 3 work out in practice

6. Change incentives and rules of evaluation!

New indices for evaluating the outcome

- Number of inputs into other projects and value added chains (the more the better)
- Change in the institutional diversity of attributes
- Change in the connectivity of the overall landscape (old channels, or new pathways?)

Change the culture of innovation!

Overview

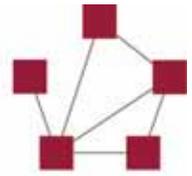

1. Know your innovation network!
2. Keep your landscape connected!
3. Facilitate cross-technology skunk works!
4. Create critical masses!
5. Create communities of innovators and adopters!
6. Change incentives and rules of evaluation!
